## 1 Some Useful Theorems

**Lemma 1** (Splitting Lemma (Hatcher p. 147)). For a short exact sequence

$$0 \to A \xrightarrow{i} B \xrightarrow{j} C \to 0$$

of abelian groups the following statements are equivalent

- 1. There is a homomorphism  $p: B \to A$  such that  $p \circ i = \mathbf{Id}_A$ .
- 2. There is a homomorphism  $s: C \to B$  such that  $j \circ s = \mathbf{Id}_C$ .
- 3. There is an isomorphism  $B \cong A \oplus C$  making the commutative diagram below, where the maps in the lower row are the obvious ones  $a \mapsto (a,0)$  and  $(a,c) \mapsto c$ .

**Lemma 2** (The Five-Lemma (Hatcher p. 129)). In a commutative diagram of abelian groups as below, if the two rows are exact and  $\alpha, \beta, \delta$ , and  $\varepsilon$  are isomorphisms then  $\gamma$  is an isomorphism.

$$A \xrightarrow{i} B \xrightarrow{j} C \xrightarrow{k} D \xrightarrow{\ell} E$$

$$\downarrow^{\alpha} \qquad \downarrow^{\beta} \qquad \downarrow^{\gamma} \qquad \downarrow^{\delta} \qquad \downarrow^{\varepsilon}$$

$$A' \xrightarrow{i'} B' \xrightarrow{j'} C' \xrightarrow{k'} D' \xrightarrow{\ell'} E'$$

**Theorem 1** (Alexander Duality). If D is a compact, locally contractible, nonempty, proper subspace of  $S^d$  then for all k there is an isomorphism

$$\Gamma_D^k: \tilde{\mathrm{H}}_k(D) \to \tilde{\mathrm{H}}^{d-k-1}(S^d \setminus D).$$

If (D,B) is a pair of such subspaces of  $S^d$  then for all k there is an isomorphism

$$\Gamma_{(D,B)}^k : \tilde{\mathrm{H}}_k(D,B) \to \tilde{\mathrm{H}}^{d-k}(S^d \setminus B, S^d \setminus D).$$

**Lemma 3** (Lemma 3.2 from [?]). Given a sequence  $A \to B \to C \to D \to E \to F$  of homomorphisms between finite-dimensional vector spaces, if  $\mathbf{rk}(A \to F) = \mathbf{rk}(C \to D)$  then this quantity also equals the rank of  $B \to E$ . Similarly, if  $A \to B \to C \to E \to F$  is a sequence of homomorphisms such that  $\mathbf{rk}(A \to F) = \dim C$  then  $\mathbf{rk}(B \to E) = \dim C$ .

### **TODO**

Excision

## 2 Separation

**Definition 1** (Separation). We say that a subset B **separates** a topological space X with the pair (U, V) if B, U, V partitions X and U, V are not path connected.

**Lemma 4.** If B separates X with the pair (U, V) then for all k the short exact sequence

$$0 \to \mathrm{H}_k(V) \xrightarrow{i_*} \mathrm{H}_k(X \setminus B) \xrightarrow{j_*} \mathrm{H}_k(U) \to 0$$

splits.

*Proof.* Because  $X \setminus B$  is the disjoint union of U and V we know that  $i_* : H_k(V) \to H_k(X \setminus B)$  is the map induced by inclusion and  $p_* : H_k(X \setminus B) \to H_k(V)$  is induced by the restriction of the identity on  $X \setminus B$  to V. Thus  $p_* \circ i_* = \mathbf{Id}_{H_k(V)}$  and therefore, by Lemma 1 the sequence splits.  $\square$ 

Corollary 1. If B separates X with the pair (U, V) then for all k

$$H_k(X \setminus B) \cong H_k(U) \oplus H_k(V).$$

**Lemma 5.** If B separates X with the pair (U, V) then for all k

$$H_k(U) \cong H_k(X \setminus B, V).$$

*Proof.* First note that the short exact sequence

$$0 \to \mathrm{H}_k(V) \to \mathrm{H}_k(U) \oplus \mathrm{H}_k(V) \to \mathrm{H}_k(U) \to 0$$

extends to a long exact sequence with the zero map  $\partial_*^k: \mathrm{H}_k(U) \to \mathrm{H}_k(V)$  as  $\mathrm{im}\ j_*^k = \mathrm{H}_k(U) = \ker\ \partial_*^k$  and  $\mathrm{im}\ \partial_*^k = \ker\ i_*^{k-1} = \mathbf{0}_{\mathrm{H}_{k-1}(V)}$ . Consider the following commutative diagram where the bottom row is the long exact sequence of the pair  $(X \setminus B, V)$ 

$$\dots \longrightarrow \mathrm{H}_{k}(V) \xrightarrow{i_{*}^{k}} \mathrm{H}_{k}(U) \oplus \mathrm{H}_{k}(V) \xrightarrow{j_{*}^{k}} \mathrm{H}_{k}(U) \xrightarrow{\partial_{*}^{k}} \mathrm{H}_{k-1}(V) \xrightarrow{i_{*}^{k-1}} \mathrm{H}_{k-1}(U) \oplus \mathrm{H}_{k-1}(V) \longrightarrow \dots$$

$$\downarrow f_{*}^{k} \qquad \qquad \downarrow g_{*}^{k} \qquad \qquad \downarrow h_{*}^{k} \qquad \qquad \downarrow f_{*}^{k-1} \qquad \qquad \downarrow g_{*}^{k-1}$$

$$\dots \longrightarrow \mathrm{H}_{k}(V) \xrightarrow{\widehat{i_{*}^{k}}} \mathrm{H}_{k}(X \setminus B) \xrightarrow{\widehat{j_{*}^{k}}} \mathrm{H}_{k}(U) \xrightarrow{\widehat{\partial_{*}^{k}}} \mathrm{H}_{k-1}(V) \xrightarrow{\widehat{i_{*}^{k-1}}} \mathrm{H}_{k-1}(X \setminus B) \longrightarrow \dots$$

As  $f_*^k$  is the identity map and, by Corollary 1,  $g_*^k$  is an isomorphism for all k it follows that  $h_*^k$  is an isomorphism for all k by Lemma 2.

**Definition 2** (Surrounding). We say that  $B \subset D$  surrounds  $D \subset X$  in X if B separates X with the pair  $(D \setminus B, X \setminus D)$ . We will refer to such a pair (D, B) as a surrounding pair in X.

The following is a corollary of Theorem 1 (Alexander Duality).

**Corollary 2.** If (D, B) is a surrounding pair of locally contractible, nonempty, proper subspaces in  $S^d$  then for all k

$$\tilde{H}_k(D,B) \cong \tilde{H}^{d-k}(D \setminus B).$$

In the following we will assume that (D, B) is a surrounding pair of locally contractible, nonempty, proper subspaces in  $S^d$ . Let  $(\overline{B}, \overline{D}) = (S^d \setminus B, S^d \setminus D)$  denote the complement of the pair (D, B) in  $S^d$ .

**Lemma 6.** If (D, B) is a surrounding pair of locally contractible, nonempty, proper subspaces of  $S^d$  then

$$i_*^k : \tilde{\mathrm{H}}_{k+1}(D,B) \to \tilde{\mathrm{H}}_k(B)$$

is injective and

$$j_*^k : \tilde{\mathrm{H}}_k(B) \to \tilde{\mathrm{H}}_k(D)$$

is surjective for all k.

*Proof.* We have the following commutative diagram of long exact sequences of the pairs (D, B) and  $(\overline{B}, \overline{D})$ .

$$\tilde{\mathbf{H}}_{k+1}(D,B) \xrightarrow{\partial_{*}^{k+1}} \tilde{\mathbf{H}}_{k}(B) \xrightarrow{i_{*}^{k}} \tilde{\mathbf{H}}_{k}(D) 
\downarrow^{\Gamma_{(D,B)}^{k+1}} \qquad \downarrow^{\Gamma_{B}^{k}} \qquad \downarrow^{\Gamma_{D}^{k}} 
\tilde{\mathbf{H}}^{d-k-1}(\overline{B},\overline{D}) \xrightarrow{\overline{j_{*}^{d-k-1}}} \tilde{\mathbf{H}}^{d-k-1}(\overline{B}) \xrightarrow{\overline{i_{*}^{d-k-1}}} \tilde{\mathbf{H}}^{d-k-1}(\overline{D})$$
(1)

Because B surrounds D we have that

$$\tilde{\mathrm{H}}_{d-k-1}(\overline{B}) \cong \tilde{\mathrm{H}}_{d-k-1}(D \setminus B) \oplus \mathrm{H}_{k}(\overline{D})$$

by Lemma ??, where  $\tilde{\mathrm{H}}_{d-k-1}(D \setminus B) \cong \tilde{\mathrm{H}}_{d-k-1}(\overline{B}, \overline{D})$  by Lemma 5. It follows that  $\overline{j_*^{d-k-1}}$  is injective and  $\overline{i_*^{d-k-1}}$  is surjective.

By commutativity of Diagram 1 and because  $\Gamma_{(D,B)}^{k+1}$ ,  $\Gamma_B^k$  and  $\Gamma_D^k$  are isomorphisms we have that

$$\partial_*^{k+1} = (\Gamma_B^k)^{-1} \circ \overline{j_*^{d-k-1}} \circ \Gamma_{(D,B)}^{k+1}$$

is injective and

$$i_*^k = (\Gamma_D^k)^{-1} \circ \overline{i_*^{d-k-1}} \circ \Gamma_B^{k+1}$$

is surjective.

We note that this implies the following for non-reduced homology 1 for subsets of  $\mathbb{R}^{d,2}$ 

### <sup>1</sup>TODO reasoning:

- consider  $H_1(D,B) \to H_0(B)$ .
- $\tilde{\mathrm{H}}_{0}(B) \to \tilde{\mathrm{H}}_{0}(D)$  surjective implies  $\mathrm{H}_{0}(B) \to \mathrm{H}_{0}(D)$  surjective (right?).

#### <sup>2</sup>TODO reasoning:

- $S^d \cong \mathbb{R}^d \cup \{\infty\}$ .
- Only requires spaces and complements remain compact?

**Corollary 3.** If (D, B) is a surrounding pair of locally contractible, nonempty, proper subspaces of  $\mathbb{R}^d$  then

$$i_*^k: \mathcal{H}_{k+1}(D,B) \to \mathcal{H}_k(B)$$

is injective and

$$j_*^k: \mathrm{H}_k(B) \to \mathrm{H}_k(D)$$

is surjective for all k.

# 3 Separating Covers

In the following let  $\mathbf{d}(x,y) = ||x-y||$  denote the euclidean distance between points  $x,y \in \mathbb{R}^d$ . For  $A \subset \mathbb{R}^d$  and  $x \in \mathbb{R}^d$  let

$$\mathbf{d}_A(x) = \min_{a \in A} \mathbf{d}(x, a)$$

denote the distance from x to the set A. In the following, we will use open metric balls

$$\mathbf{ball}_{\varepsilon}(x) = \{ y \in \mathbb{R}^d \mid \mathbf{d}(x, y) < \varepsilon \}$$

and offsets

$$A^{\varepsilon} = \mathbf{d}_A^{-1}[0, \varepsilon) = \{x \in \mathbb{R}^d \mid \mathbf{d}_A(x) < \varepsilon\}.$$

Let (D, B) be a surrounding pair in  $\mathbb{R}^d$ . For subsets  $Y \subset X$  of D suppose  $D \setminus B \subseteq X$  and Y separates D with a pair (U, V) such that  $D \setminus B \subseteq U$ . Let  $(\hat{X}, \hat{Y}) = (X \cup V, Y \cup V)$  denote the *extension* of the pair (X, Y) in (D, B).

**Definition 3** (Separating Cover). For  $\delta > 0$ ,  $\gamma > \delta$ , and finite subsets  $P \subset D$ ,  $Q \subset P \cap B$  we say that (P,Q) is an **(open) separating**  $(\delta,\gamma)$ -cover of (D,B) if

- (a)  $D \setminus B \subseteq P^{\delta}$ ,
- (b)  $Q^{\delta}$  separates D with the pair (U, V) such that  $D \setminus B \subseteq U$ , and
- (c)  $(\hat{P}^{\delta}, \hat{Q}^{\delta}) \subseteq (D, B) \subseteq (\hat{P}^{\gamma}, \hat{Q}^{\gamma}).$

**Lemma 7.** If (P,Q) is an (open) separating  $(\delta,\gamma)$ -cover of a surrounding pair (D,B) then

$$H_k(P^{\delta}, Q^{\delta}) \cong H_k(\hat{P}^{\delta}, \hat{Q}^{\delta}).$$

*Proof.* Clearly  $\hat{P}^{\delta} \setminus V = P^{\delta}$  and  $\hat{Q}^{\delta} \setminus V = Q^{\delta}$ . Because  $Q^{\delta}$  is an open set V is closed<sup>3</sup>, so  $\operatorname{cl}(V) = V \subset \operatorname{int}(\hat{Q}^{\delta})$ . The isomorphism follows by excision.

For any separating  $(\delta, \gamma)$ -cover (P, Q) of a surrounding pair (D, B) clearly  $Q^{\gamma}$  separates D and  $D \setminus B \subseteq P^{\gamma}$ . Therefore, let  $(\hat{P}^{\gamma}, \hat{Q}^{\gamma})$  denote the extension of  $(P^{\gamma}, Q^{\gamma})$  in D and note that  $H_k(P^{\gamma}, Q^{\gamma}) \cong H_k(\hat{P}^{\gamma}, \hat{Q}^{\gamma})$ .

**Lemma 8.** If (D, B) is an open surrounding pair in  $\mathbb{R}^d$  and (P, Q) is an (open) separating  $(\delta, \gamma)$ -cover of (D, B) then there is an isomorphism

$$H_k(P^{\delta}, P^{\delta} \cap B) \to H_k(D, B)$$

induced by inclusion for all k.

- Define separating pair as separating  $\mathbb{R}^d$  with  $D \setminus B \subset U$  and  $\overline{D} \subset V$
- tricky bzns where D is taken as a metric subspace (side effects?)

<sup>&</sup>lt;sup>3</sup>TODO  $V = D \setminus (Q^{\delta} \cup U)$  for open D. clopen? D must be open for next excision. options:

*Proof.* Because (D,B) is an open pair of subsets and (P,Q) is a separating  $(\delta,\gamma)$ -cover of (D,B) we know that  $B\subset D$ ,  $P^\delta\subseteq D$ , and  $D\setminus B\subseteq P^\delta$ . Moreover, because B and  $P^\delta$  are open sets  $\operatorname{int}(P^\delta)=P^\delta$  and  $\operatorname{int}(B)=B$ . So  $P^\delta\cup B=\operatorname{int}(P^\delta)\cup\operatorname{int}(B)\subseteq D$  and

$$D = (D \setminus B) \cup B \subseteq P^{\delta} \cup B$$

thus  $\operatorname{int}(P^{\delta}) \cup \operatorname{int}(B) = D$  which implies the inclusion  $(P^{\delta}, P^{\delta} \cap B) \hookrightarrow (D, B)$  induces an isomorphism in homology by excision.

Because (D,B) is a surrounding pair in  $\mathbb{R}^d$  we know that B separates  $\mathbb{R}^d$  with the pair  $(D\setminus B,\overline{D})$ . So there is no path from  $D\setminus B$  to  $\overline{D}$  that does not cross B. As  $D\setminus B\subseteq V$ ,  $Q^\delta\subseteq B$ , and U,V and  $Q^\delta$  partition D it follows that  $U\subset B$  and therefore that  $(\hat{P}^\delta,\hat{Q}^\delta)\subseteq (D,B)\subseteq (\hat{P}^\gamma,\hat{Q}^\gamma)$ . Similarly,  $H_k(\hat{P}^\delta,\hat{P}^\delta\cap B)\cong H_k(D,B)$ .

<sup>&</sup>lt;sup>4</sup>TODO rigor.

# 4 Chasing

**Theorem 2.** Let  $(\mathcal{D}, \mathcal{B})$  be a surrounding pair of open subsets of  $\mathbb{R}^d$  and let  $P \subset \mathcal{D}$  be a finite subset of  $\mathcal{D}$ . Let (P,Q) be an (open) separating  $(\delta, \gamma)$ -cover of  $(\mathcal{D}, \mathcal{B})$  for  $\gamma > \delta > 0$ . Let  $(D_0, B_0)$  and  $(D_1, B_1)$  be surrounding pairs of nonempty, compact subsets of  $\mathbb{R}^d$  such that  $B_0 \subseteq \hat{Q}^{\delta}$ ,  $\hat{Q}^{\gamma} \subseteq B_1$ , and

$$(D_0, B_0) \subset (\mathcal{D}, \mathcal{B}) \subset (D_1, B_1).$$

If

im 
$$H_k((D_0, B_0) \hookrightarrow (D_1, B_1)) \cong H_k(\mathcal{D}, \mathcal{B})$$

then

im 
$$H_k((P^{\delta}, Q^{\delta}) \hookrightarrow (P^{\gamma}, Q^{\gamma})) \cong H_k(\mathcal{D}, \mathcal{B}).$$

Proof. As  $H_k(P^{\delta}, Q^{\delta}) \cong H_k(\hat{P}^{\delta}, \hat{Q}^{\delta})$  and  $H_k(P^{\gamma}, Q^{\gamma}) \cong H_k(\hat{P}^{\gamma}, \hat{Q}^{\gamma})$  we know that  $\operatorname{im} H_k((P^{\delta}, Q^{\delta}) \hookrightarrow (P^{\gamma}, Q^{\gamma})) \cong \operatorname{im} H_k((\hat{P}^{\delta}, \hat{Q}^{\delta}) \hookrightarrow (\hat{P}^{\gamma}, \hat{Q}^{\gamma}))$ . So we will refer to  $(\hat{P}^{\delta}, \hat{Q}^{\delta})$  and  $(\hat{P}^{\gamma}, \hat{Q}^{\gamma})$  as  $(P^{\delta}, Q^{\delta})$  and  $(P^{\gamma}, Q^{\gamma})$  w.l.o.g. throughout.

In the following let

$$\eta_B^k : \mathcal{H}_k(B_0) \to \mathcal{H}_k(B_1), 
\eta_D^k : \mathcal{H}_k(D_0) \to \mathcal{H}_k(D_1), \text{ and} 
\eta^k : \mathcal{H}_k(D_0, B_0) \to \mathcal{H}_k(D_1, B_1).$$

Consider the commutative diagram of long exact sequences of the pairs  $(D_0, B_0), (\mathcal{D}, \mathcal{B})$  and  $(D_1, B_1)$ .

$$H_{k}(B_{0}) \xrightarrow{i_{0}^{k}} H_{k}(D_{0}) \xrightarrow{j_{0}^{k}} H_{k}(D_{0}, B_{0}) \xrightarrow{\partial_{0}^{k}} H_{k-1}(B_{0}) \xrightarrow{i_{0}^{k-1}} H_{k-1}(D_{0}) 
\downarrow_{a^{k}} \qquad \downarrow_{b^{k}} \qquad \downarrow_{d^{k}} \qquad \downarrow_{a^{k-1}} \qquad \downarrow_{b^{k-1}} 
H_{k}(\mathcal{B}) \xrightarrow{i_{*}^{k}} H_{k}(\mathcal{D}) \xrightarrow{j_{*}^{k}} H_{k}(\mathcal{D}, \mathcal{B}) \xrightarrow{\partial_{*}^{k}} H_{k-1}(\mathcal{B}) \xrightarrow{i_{*}^{k-1}} H_{k-1}(\mathcal{D}) 
\downarrow_{f^{k}} \qquad \downarrow_{g^{k}} \qquad \downarrow_{h^{k}} \qquad \downarrow_{f^{k-1}} \qquad \downarrow_{g^{k-1}} 
H_{k}(B_{1}) \xrightarrow{i_{1}^{k}} H_{k}(D_{1}) \xrightarrow{j_{1}^{k}} H_{k}(D_{1}, B_{1}) \xrightarrow{\partial_{1}^{k}} H_{k-1}(B_{1}) \xrightarrow{i_{1}^{k-1}} H_{k-1}(D_{1})$$

$$(2)$$

Because  $(D_0, B_0)$  and  $(D_1, B_1)$  are nonempty, compact surrounding pairs of  $\mathbb{R}^d$  we can embed them in  $S^d \cong \mathbb{R}^d \cup \{\infty\}$  in order to show that  $i_0^k$  and  $i_1^k$  are surjective by Lemma 6. So, by exactness,  $\operatorname{im} i_0^k = \ker j_0^k = \operatorname{H}_k(D_0)$  and  $\operatorname{im} i_1^k = \ker j_1^k = \operatorname{H}_k(D_1)$ . It follows that for any  $[y''] \in \operatorname{im} \eta^k$  with preimage  $[y] \in \operatorname{H}_k(D_0, B_0)$  we must have that  $[y''] \in \operatorname{cok} j_1^k$  and  $[y] \in \operatorname{cok} j_0^k$ . That is, there must exist nonzero  $[z] = \partial_0^k[y]$  in  $\operatorname{H}_{k-1}(B_0)$  and  $[z''] = \partial_1^k[y'']$  in  $\operatorname{H}_{k-1}(B_1)$  such that  $\eta_B^{k-1}[z] = [z'']$ . Moreover, because  $\eta^k$  factors through  $\operatorname{H}_k(\mathcal{D}, \mathcal{B})$  and  $\eta_B^{k-1}$  factors through  $\operatorname{H}_{k-1}(\mathcal{B})$  there must exist nonzero  $[y'] = d^k[y]$  in  $\operatorname{H}_k(\mathcal{D}, \mathcal{B})$  and  $[z'] = \partial_*^k[y'] = a^{k-1}[z]$  in  $\operatorname{H}_{k-1}(\mathcal{B})$  such that  $h^k[y'] = [y'']$  and  $f^{k-1}[z'] = [z'']$ .

Consider the long exact sequences of the pairs  $(P^{\delta}, P^{\delta} \cap \mathcal{B}), (P^{\delta}, Q^{\delta})$ .

$$\ldots \to \mathrm{H}_k(P^{\delta}, P^{\delta} \cap \mathcal{B}) \xrightarrow{\widehat{\partial_*^k}} \mathrm{H}_{k-1}(P^{\delta} \cap \mathcal{B}) \xrightarrow{i_*^{\widehat{k-1}}} \mathrm{H}_{k-1}(P^{\delta}) \to \ldots,$$

$$\dots \to \mathrm{H}_k(P^\delta, Q^\delta) \xrightarrow{\partial_\delta^k} \mathrm{H}_{k-1}(Q^\delta) \xrightarrow{p_\delta^{k-1}} \mathrm{H}_{k-1}(P^\delta) \to \dots,$$

and the following commutative diagrams taken from the long exact sequences of the pairs  $(D_0, B_0), (P^{\delta}, P^{\delta} \cap \mathcal{B})$  and  $(P^{\delta}, Q^{\delta}), (P^{\delta}, P^{\delta} \cap \mathcal{B})$ , respectively.

where  $\xi^k: H_k(\mathcal{D}, \mathcal{B}) \to H_k(P^\delta, P^\delta \cap \mathcal{B})$  is the isomorphism given by excision in Lemma 8 and  $\widehat{a^{k-1}}, \widehat{\psi_{\delta}^{k-1}}$  are homomorphisms induced by inclusion.

Because  $\xi^k$  is an isomorphism there exists a nonzero  $[\widehat{y'}] = \xi^k[y']$  in  $H_k(P^\delta, P^\delta \cap \mathcal{B})$  and, because  $P^\delta \cap \mathcal{B} \subset \mathcal{B}$  the map  $a^{k-1}$  factors through  $H_{k-1}(P^\delta \cap \mathcal{B})$ , so there must exist some nonzero  $\widehat{|z'|} = \widehat{a^{k-1}}[z]$  in  $H_{k-1}(P^{\delta} \cap \mathcal{B})$  such that  $\widehat{\partial_*^k}[\widehat{y'}] = \widehat{[z']}$  by commutativity of diagram ??.

Now, letting  $\phi_0^{k-1}: \mathcal{H}_{k-1}(B_0) \to \mathcal{H}_{k-1}(Q^{\delta})$  be induced by inclusion we have that  $\widehat{a^{k-1}} =$  $\widehat{\psi_{\delta}^{k-1}} \circ \phi_0^{k-1}$  so  $\phi_0^{k-1}[z]$  is nonzero in  $H_{k-1}(Q^{\delta})$ . Because  $\widehat{[z']} \in \mathbf{im} \ \widehat{\partial_*^k}$  we have that  $\widehat{[z']} \in \mathbf{im}$  $\widehat{\mathbf{ker}} \ \widehat{i_*^{k-1}}. \ \text{By commutativity of diagram ??} \ p_{\delta}^{k-1} = \widehat{i_*^{k-1}} \circ \widehat{\psi_{\delta}^{k-1}} \ \text{thus} \ \phi_0^{k-1}[z] \in \widehat{\mathbf{ker}} \ p_{\delta}^{k-1} \ \text{which implies} \ \phi_0^{k-1}[z] \in \widehat{\mathbf{im}} \ \partial_{\delta}^k \ \text{by exactness.}$ 

We can therefore construct a homomorphism  $\mu^k: H_k(D_0, B_0) \to H_k(P^\delta, Q^\delta)$  for  $[y] \in H_k(D_0, B_0)$  as the preimage of  $\partial_0^k \circ \phi_0^{k-1}[y]$  in  $H_k(P^\delta, Q^\delta)$  for  $[y] \in \mathbf{im} \ \eta^k$ , 0 otherwise, Now, consider the long exact sequence of the pair  $(P^{\gamma}, Q^{\gamma})$ 

$$\dots \to \mathrm{H}_k(P^{\gamma}, Q^{\gamma}) \xrightarrow{\partial_{\gamma}^k} \mathrm{H}_{k-1}(P^{\delta} \cap \mathcal{B}) \xrightarrow{p_{\gamma}^{k-1}} \mathrm{H}_{k-1}(P^{\gamma}) \to \dots$$

We have the following commutative diagrams

$$\begin{array}{cccc}
H_{k-1}(\mathcal{B}) & \xrightarrow{i_*^{k-1}} & H_{k-1}(\mathcal{D}) & & H_k(P^{\gamma}, Q^{\gamma}) & \xrightarrow{\partial_{\gamma}^k} & H_{k-1}(Q^{\gamma}) \\
\downarrow^{\psi_{\gamma}^{k-1}} & \downarrow^{\sigma_{\gamma}^{k-1}} & & \downarrow^{\phi_{\gamma}^{k-1}} & \downarrow^{\phi_{\gamma}$$

where  $\psi_{\gamma}^{k-1}$ ,  $\sigma_{\gamma}^{k-1}$ ,  $\phi_{1}^{k-1}$  and  $\nu^{k}$  are induced by inclusion. Because  $[z'] \in \mathbf{im} \ \partial_{*}^{k}$  we have  $[z'] \in \mathbf{ker} \ i_{*}^{k-1}$  by exactness and, by commutativity of diagram ??,  $p_{\gamma}^{k-1} \circ \psi_{\gamma}^{k-1} = \sigma_{\gamma}^{k-1} \circ i_{*}^{k-1}$ . Noting that  $f^{k-1}$  factors through  $H_{k-1}(Q^{\gamma})$  as  $f^{k-1} = \phi_{1}^{k-1} \circ \psi_{\gamma}^{k-1}$  we have that  $\psi_{\gamma}^{k-1}[z']$  is nonzero in  $H_{k-1}(Q^{\gamma})$ . So  $\psi_{\gamma}^{k-1}[z'] \in \mathbf{ker} \ p_{\gamma}^{k-1}$  thus  $\psi_{\gamma}^{k-1}[z'] \in \mathbf{im} \ H_{k}(P^{\gamma}, Q^{\gamma})$  by exactness.

So we may conclude that  $\eta^k$  factors through  $\tau^k: H_k(P^\delta,Q^\delta) \to H_k(P^\gamma,Q^\gamma)$  with the maps  $\mu^k = (\partial_\delta^k)^{-1} \circ \phi_0^{k-1} \circ \partial_0^k$  and  $\nu^k: H_k(P^\gamma,Q^\gamma) \to H_k(D_1,B_1)$  induced by inclusion. We therefore have the following sequence of homomorphisms

$$H_k(D_0, B_0) \xrightarrow{\mu^k} H_k(P^\delta, Q^\delta) \to H_k(\mathcal{D}, \mathcal{B}) \to H_k(P^\gamma, Q^\gamma) \xrightarrow{\nu^k} H_k(D_1, B_1).$$

The result follows from Lemma 3.

# 5 Connection with the TCC

# 5.1 Assumptions

Let  $P \subset \mathcal{D}$  be a finite collection of sensors p with the following capabilities.

#### Sensor Capabilities

- a. (Communication Radii) detect the presence, but not location or distance, of sensors within distances  $\delta > 0$  and  $\gamma \geq 3\delta$ , and discriminate between sensors within each scale,
- b. (Coverage Radius) cover a radially symmetric subset of the domain with radius  $\delta$ ,

We will refer to the following preliminary assumptions about pairs  $(D_0, B_0)$  and  $(D_1, B_1)$  for  $\delta > 0$  and  $\gamma \geq 3\delta$ .

### Geometric Assumptions

- 1. **(Domain)**  $(D_0, B_0)$  and  $(D_1, B_1)$  are surrounding pairs of nonempty, compact subsets of  $\mathbb{R}^d$  with  $(D_0^{\delta+\gamma}, B_0^{\delta+\gamma}) \subset (D_1, B_1)$ .
- 2. **(Boundary)**  $H_0(D_1 \setminus B_1 \hookrightarrow D_0 \setminus B_0^{2\delta})$  is surjective.

In the following let  $Q = P \cap B_0^{\delta}$  and  $(\mathcal{D}, \mathcal{B}) = (D_0^{2\delta}, B_0^{2\delta})$ .

## 5.2 Proof of the TCC

We have the following commutative diagrams of inclusions between the pairs (P,Q) and  $(\mathcal{D},\mathcal{B})$  and their complements with increasing scale.

$$(P^{\delta}, Q^{\delta}) \longleftrightarrow (P^{\gamma}, Q^{\gamma}) \quad (\overline{B_1}, \overline{D_1}) \longleftrightarrow^{j} (\overline{\mathcal{B}}, \overline{\mathcal{D}})$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$(\mathcal{D}, \mathcal{B}) \longleftrightarrow^{j} (D_1, B_1), \quad (\overline{Q^{\gamma}}, \overline{P^{\gamma}}) \longleftrightarrow^{j} (\overline{Q^{\delta}}, \overline{P^{\delta}}).$$

The following diagram is formed by applying the homology functor.

$$\begin{array}{ccc}
H_{0}(\overline{B_{1}}, \overline{D_{1}}) & \stackrel{j_{*}}{\longrightarrow} & H_{0}(\overline{\mathcal{B}}, \overline{\mathcal{D}}) \\
\downarrow & & \downarrow \\
H_{0}(\overline{Q^{\gamma}}, \overline{P^{\gamma}}) & \stackrel{i_{*}}{\longrightarrow} & H_{0}(\overline{Q^{\delta}}, \overline{P^{\delta}}).
\end{array} (5)$$

Let  $p_* : \mathbf{im} \ j_* \to \mathbf{im} \ i_*$ .

**Lemma 9.** Given assumptions 1 & 2, the map  $p_*$  is surjective.

*Proof.* Choose a basis for **im**  $i_*$  such that each basis element is represented by a point in  $P^{\delta} \setminus Q^{\gamma}$ . Let  $x \in P^{\delta} \setminus Q^{\gamma}$  be such that [x] is non-trivial in **im**  $i_*$ . Suppose  $x \in \mathcal{B}$  and let  $y \in B_0$  so that  $\mathbf{d}(x,y) < 2\delta$ .

Now, because  $x \in \overline{Q^{\gamma}}$  by hypothesis  $\mathbf{d}(x,q) \geq \gamma$  for all  $q \in Q$ . For any z in the shortest path between x and y we have  $\mathbf{d}(x,z) \leq \mathbf{d}(x,y) < 2\delta$ , so the following inequality holds for all  $q \in Q$ 

$$\mathbf{d}(x,q) \ge \mathbf{d}(x,q) - \mathbf{d}(x,z)$$

$$> \gamma - 2\delta$$

$$> \delta.$$

So  $z \in \overline{Q^{\delta}}$  for all z in the shortest path from x to y. In particular,  $x, y \in \overline{Q^{\delta}}$ .

Now, suppose  $y \in P^{\delta}$ . So there exists some  $p \in P$  such that  $\mathbf{d}(p,y) < \delta$ . So  $\mathbf{d}(p,y) < \delta$  which implies  $p \in Q$  thus  $y \in Q^{\delta}$ . But we have shown that  $y \in \overline{Q^{\delta}}$ , a contradiction, so we may assume that  $y \in \overline{P^{\delta}}$ .

Because  $x,y\in \overline{Q^\delta}$  we have corresponding chains  $x,y\in C_0(\overline{Q^\delta})$  as well as  $y\in \overline{P^\delta}$  generating a chain  $y\in C_0(\underline{P^\delta})$ . As we have shown that  $x\in \mathcal{B}$  implies that the shortest path from x to y is contained in  $\overline{Q^\delta}$  there exists a path  $h:[0,1]\to \overline{Q^\delta}$  with h(0)=x and h(1)=y that generates a chain  $h\in C_1(\overline{Q^\delta})$ . So for  $h\in C_1(\overline{Q^\delta},\overline{P^\delta})$  with  $\partial h=x+y$  we have that  $x=\partial h+y$ . Thus [x] is a relative boundary and is therefore trivial in  $H_0(\overline{P^\delta},\overline{Q^\delta})$ , a contradiction, as we have assumed [x] is non-trivial in  $\mathbf{im}\ i_*$ . So we may conclude that  $x\notin \mathcal{B}$ .

So  $x \in \overline{\mathcal{B}}$  and  $x \in \mathcal{D} \setminus \mathcal{B}$ . So [x] is non-trivial in  $H_0(\overline{\mathcal{B}}, \overline{\mathcal{D}})$  and, because  $j_*$  is surjective,  $\operatorname{im} j_* = H_0(\overline{\mathcal{B}}, \overline{\mathcal{D}})$ . So  $p_*$  is surjective as  $p_*[x] = [x] \in \operatorname{im} p_*$  for all non-trivial  $[x] \in \operatorname{im} i_*$ .  $\square$ 

**Lemma 10.** Given assumptions 1 & 2, if  $p_*$  is injective then  $\mathcal{D} \setminus \mathcal{B} \subseteq P^{\delta}$ .

*Proof.* Suppose, for the sake of contradiction, that  $p_*$  is injective and there exists a point  $x \in (\mathcal{D} \setminus \mathcal{B}) \setminus P^{\delta}$ . So [x] is non-trivial in  $H_0(\overline{\mathcal{B}}, \overline{\mathcal{D}}) = \operatorname{im} j_*$  as x is in some connected component of  $\mathcal{D} \setminus \mathcal{B}$  and  $j_*$  is surjective. So we have the following sequence of maps induced by inclusions

$$H_0(\overline{\mathcal{B}}, \overline{\mathcal{D}}) \xrightarrow{f_*} H_0(\overline{\mathcal{B}}, \overline{\mathcal{D}} \cup \{x\}) \xrightarrow{g_*} H_0(\overline{Q^\delta}, \overline{P^\delta}).$$

As  $f_*[x]$  is trivial in  $H_0(\overline{\mathcal{B}}, \overline{\mathcal{D}} \cup \{x\})$  we have that  $p_*[x] = (g_* \circ f_*)[x]$  is trivial, contradicting our hypothesis that  $p_*$  is injective.

**Lemma 11.** Given assumptions 1 & 2, if the map  $p_*$  is injective then  $Q^{\delta}$  separates  $\mathcal{D}$ .

*Proof.* Suppose, for the sake of contradiction, that  $Q^{\delta}$  does not separate  $\mathcal{D}$ . Then for all (U,V) such that  $U \cup V = \mathcal{D} \setminus Q^{\delta}$  there must exist some path from U to V that does not cross  $Q^{\delta}$ . Formally, there exists a path  $\pi: [0,1] \to \overline{Q^{\delta}}$  with  $\pi(0) \in U$  and  $\pi(1) \in V$ . Noting that  $\overline{\mathcal{B}} \subseteq \overline{Q^{\delta}}$  and, because  $\mathcal{B}$  surrounds  $\mathcal{D}$ ,  $\overline{\mathcal{B}} = \overline{\mathcal{D}} \cup (\mathcal{D} \setminus \mathcal{B})$ , so we can choose (U,V) such that  $\mathcal{D} \setminus \mathcal{B} \subset U$  and  $\overline{\mathcal{D}} \subset V$ .

Choose  $x \in \mathcal{D} \setminus \mathcal{B}$  and  $y \in \overline{\mathcal{D}}$  such that there exist paths  $\pi_x : [0,1] \to U$  with  $\pi_x(0) = x$ ,  $\pi_x(1) = \pi(0)$  and  $\pi_y : [0,1] \to V$  with  $\pi_y(0) = y$ ,  $\pi_y(1) = \pi(1)$ .  $\pi_x, \pi_y$  and  $\pi$  all generate chains in  $C_1(\overline{Q^\delta}, \overline{P^\delta})$  and  $\pi_x + \pi + \pi_y = \pi^* \in C_1(\overline{Q^\delta}, \overline{P^\delta})$  with  $\partial \pi^* = x + y$ . Moreover, y generates a chain in  $C_0(\overline{P^\delta})$  as  $\overline{\mathcal{D}^{2\delta}} \subseteq \overline{P^\delta}$ . So  $x = \partial \pi^* + y$  is a relative boundary in  $C_0(\overline{Q^\delta}, \overline{P^\delta})$  thus [x] = 0 = [y] in  $H_0(\overline{Q^\delta}, \overline{P^\delta})$  and therefore [x] = [y] in  $\mathbf{im}$   $i_*$ . However, because  $\mathcal{B}$  surrounds  $\mathcal{D}$  we know that  $[x] \neq [y]$  in  $H_0(\overline{\mathcal{B}}, \overline{\mathcal{D}}) \cong \mathbf{im}$   $j_*$ , contradicting our assumption that  $p_*$  is injective.

**Lemma 12.** Given assumptions 1 & 2, if  $p_*$  is injective then  $\mathcal{B} \subseteq \hat{Q}^{\gamma}$ .

Proof. Suppose  $p_*$  is injective and there exists some  $x \in \mathcal{B}$  such that  $x \notin \hat{Q}^{\gamma}$ . Because  $\mathcal{B} = B_0^{2\delta}$  there must exist some  $y \in B_0$  such that  $\mathbf{d}(x,y) < 2\delta$ . By Lemma 11  $Q^{\delta}$  separates  $\mathcal{D}$  with a pair (U,V) therefore x and y are each either in  $Q^{\delta}$ , V or U. So  $x \in \mathcal{B} \setminus \hat{Q}^{\gamma} = \mathcal{B} \cap (U \setminus Q^{\gamma})$  and  $y \in B_0 \subseteq \hat{Q}^{\delta}$ .

If  $y \in Q^{\delta}$  then there exists some  $q \in Q$  such that  $\mathbf{d}(q, y) < \delta$  so

$$\mathbf{d}(q, x) \le \mathbf{d}(q, y) + \mathbf{d}(x, y) < 3\delta \le \gamma$$

which implies  $x \in Q^{\gamma}$ .

As  $x \in \mathcal{B} \cap (U \setminus Q^{\gamma})$  we may assume that  $y \in B_0 \cap \overline{Q^{\delta}} = B_0 \cap (U \cup V) = B_0 \cap V$ . Because  $Q^{\delta}$  separates  $\mathcal{D}$  with (U, V) there is no path from  $x \in U$  to  $y \in V$  that does not cross  $Q^{\delta}$ , so there must be some point  $z \in Q^{\delta}$  in the shortest path from x to y. That is, there exists some  $q \in Q$  such that  $\mathbf{d}(q, z) < \delta$  and  $\mathbf{d}(z, x) < \mathbf{d}(x, y) < 2\delta$  so

$$\mathbf{d}(q, x) \le \mathbf{d}(q, z) + \mathbf{d}(z, x) < \delta + 2\delta \le \gamma.$$

So  $y \in V$  implies  $x \in \hat{Q}^{\gamma}$ .

**Theorem 3** (Geometric TCC). Let  $(D_0, B_0)$  and  $(D_1, B_1)$  be surrounding pairs of nonempty, compact subsets of  $\mathbb{R}^d$  satisfying assumptions 1 & 2 for  $\delta > 0$ , and  $\gamma > 3\delta$ . Let  $P \subset D_0$  be a finite collection of sensors and  $Q = P \cap B_0^{\delta}$ . Let  $(\mathcal{D}, \mathcal{B}) = (D_0^{2\delta}, B_0^{2\delta})$  and  $p_* : \operatorname{im} j_* \to \operatorname{im} i_*$  for  $j_*$ ,  $i_*$  as defined in Diagram 5.

If  $\mathbf{rk} \ i_* \geq \mathbf{rk} \ j_* \ then \ (P,Q) \ is \ an \ (open) \ separating \ (\delta,\gamma)$ -cover of  $(\mathcal{D},\mathcal{B})$ .

*Proof.* Because P is a finite point set we know that  $\mathbf{im}\ i_*$  is finite-dimensional. Because  $\mathbf{rk}\ i_* \geq \mathbf{rk}\ j_*\ j_*$  is finite dimensional as well so  $p_*$  is injective. Therefore  $\mathcal{D} \setminus \mathcal{B} \subseteq P^{\delta}$  by Lemma 10 and  $Q^{\delta}$  separates  $\mathcal{D}$  by Lemma 11. Because  $Q^{\delta}$  separates  $\mathcal{D}$  with a pair (U, V) and  $\mathcal{D} \setminus \mathcal{B} \subset P^{\delta}$  we can extend  $(P^{\delta}, Q^{\delta})$  and  $(P^{\gamma}, Q^{\gamma})$  to the pairs  $(\hat{P}^{\delta}, \hat{Q}^{\delta})$  and  $(\hat{P}^{\gamma}, \hat{Q}^{\gamma})$ .

As  $P \subset B_0$  and  $Q = P \cap B_0^{\delta}$  we have that  $(P^{\delta}, Q^{\delta}) \subset (D_0^{2\delta}, B_0^{2\delta}) = (\mathcal{D}, \mathcal{B})$ . Because  $\mathcal{B}$  surrounds  $\mathcal{D}$  in  $\mathbb{R}^d$  we know that  $\mathcal{B}$  separates  $\mathbb{R}^d$  with the pair  $(\mathcal{D} \setminus \mathcal{B}, \mathbb{R}^d \setminus \mathcal{D})$ . So  $\hat{P}^{\delta} = P^{\delta} \cup V$  with  $U \cup V \cup Q^{\delta} = \mathcal{D}$  implies  $\hat{P}^{\delta} \subset \mathcal{D}$  and  $\hat{Q}^{\delta} = Q^{\delta} \cup V$  implies  $\hat{Q}^{\delta} \subset \mathcal{B}$ . Moreover, because  $p_*$  is injective  $\mathcal{B} \subseteq \hat{Q}^{\gamma}$  by Lemma 12. Finally,  $\mathcal{D} \setminus \mathcal{B} \subset P^{\delta}$  and  $\mathcal{B} = B_0^{2\delta}$  implies that  $\mathcal{D} = D_0 \subset P^{\gamma}$  so  $\mathcal{D} = D_0^{2\delta} \subset \hat{P}^{\gamma}$ .

As  $\mathcal{D} \setminus \mathcal{B} \subseteq P^{\delta}$ ,  $Q^{\delta}$  separates  $\mathcal{D}$ , and  $(\hat{P}^{\delta}, \hat{Q}^{\delta}) \subseteq (\mathcal{D}, \mathcal{B}) \subseteq (\hat{P}^{\gamma}, \hat{Q}^{\gamma})$  we may conclude that (P, Q) is an (open) separating  $(\delta, \gamma)$ -cover of  $(\mathcal{D}, \mathcal{B})$ .

<sup>&</sup>lt;sup>5</sup>**TODO** need  $\mathcal{D} \setminus \mathcal{B} \subset U$ .
